

# Fip Interactive JavaScript Roadmap

- JavaScript interactive coding was only applied at the “Why Us” Page.

## CSS :

- Png bottle image is placed and given a position of ‘relative’, so the button clicks could be placed on top of it.
- So the button clicks were also given a position of ‘absolute’, so that they could be placed on top of them.

## JavaScript :

- const variables were declared such as - **btnc** (for button clicks), **num** (for indexing the button clicks and the information displayed for it) and **Info** (for displaying the information)
- const array **seclInfo** was declared to store the secret information.
- Function **getInfo()**, was made to get secret information from the array and display it on the div (which is declared as **Info** in js).
- Function **getInfoNum()**, will get the secret information from an array and store it. This function will be used inside the **getInfo()**.
- EventListener will be added to **btnc** for displaying the information when the user clicks the button.
